Abstract (en)  
[origin: EP2770122A2] The fitting has a water discharge spacer (26) acted upon with low pressure (pU) during closing a valve element (43). Water contained in the water discharge spacer is partially sucked back into a water reservoir (33) counter to an outflow direction (F). A spacer breaker is arranged in the water discharge spacer, and separates a water column in the water discharge spacer into two partial columns during closing the valve element, where the partial columns run into the outflow direction from a discharge opening.
