Abstract (en)

[origin: WO2013060474A1] The aim of a method for operating a gasification reactor (1) that comprises a reaction chamber (4) for the autothermic and/or allothermic gasification of carbonaceous combustible material into useful gases is to improve the efficiency of a gasification reactor for gasifying carbonaceous combustible material into useful gases with respect to useful gas yield and thermal yield as well as to the operational stability of the gasification reactor. To this end, the composition, quantity, pressure, speed, temperature and/or specific discharge pulse of a gasification agent that is fed via control inlets (10) of the reaction chamber (4) are controlled in a variable manner by means of a number of controlled variables that are detected in the reaction chamber (4), the composition (34) of the useful gas and/or the volume flow (30) of the useful gas and/or the respective pressure (36) in a reservoir (3) for the combustible material, in the reaction chamber (4) and/or in a gas outlet (8) being used as a controlled variable (30, 32, 34, 36, 38, 40).
