Abstract (en)  
[origin: WO2013064387A1] The invention relates to a cover (1) including a shell (20) for closing an opening (101) and a latch (4) pivoting between "unlocked" and "locked" positions in which said latch respectively does not or does hinder the mobility of the cover (1) with respect to the support (100), the cover (1) comprising stationary stops (51) and laterally flexible latching lugs (44) provided to prevent the passage without bending of the latching lugs (44) and to latch the latch (4) in the "locked" position, the clearances (50) allowing the passage of the bent latching lugs (44) and of the unlatching wings (45) connected to the latching lugs (44) and capable of being biased laterally by hand to bend the latching lugs (44) and thus allow the unlatching of the latch (4) from the "locked" position thereof. Said cover (1) is suitable for closing an opening (101) provided in a motor block for accommodating an electronic sensor therein.
