Abstract (en)

[origin: EP2775080A1] The device (1) has a power supply (5) and a keyboard unit (6) for controlling a drive (2) to open and close a window. Switching signals of the keyboard unit are converted into three signal levels. Zener diodes produce the signal levels. A signal is outputted to the drive. The first signal level produces a stop and/or idle state of the drive. The second signal level produces actuation of the drive to open a window (3). The third signal level produces actuation of the drive to close the window. The signal levels are linked by a wired-or-linkage, which is formed by diodes.
