Abstract (en)

[origin: WO2013068673A1] The kit (1) comprises: a dorsal element (3) intended to be placed against the lumbar region of an individual, and comprising reinforcing members; a set of N strips (4) of elastic textile that can be positioned around the lower part of the trunk of the individual and comprises assembly means (19) able to collaborate removably with complementary assembly means (18) formed on the dorsal element. Each of the N strips has a certain number of structural characteristics, at least one structural characteristic differing from one strip to another within the set of N strips. The kit thus makes it possible to create a lumbar support girdle comprising said dorsal element and a single strip chosen from the set of N strips according to said structural characteristic desired.
