Abstract (en)  
[origin: WO2013067999A1] The invention relates to an exercise machine for exercising at least one limb, in particular for use in rehabilitation and/or fitness, with a supporting frame (2) and a generator of circular motion (3), which can be rotated on a rotary shaft (4) associated with the supporting frame (2), and a limb support (12) for resting and/or supporting at least one limb. A rotational shaft (6) arranged radially off-set with respect to the rotary shaft (4) of the generator of circular motion (3) is associated with the generator of circular motion (3) to rotatably mount a rotator (5). The limb support (12) is associated with the rotator (5), preferably eccentric to the rotational shaft (6). The trajectory of the limb support (12) is elliptical, the ellipse being formed by an overlapping of the circular motions of the generator of circular motion (3) and the rotator (5).
