Abstract (en)
[origin: WO2013067985A1] The present invention relates to a clutch device having at least one counter-pressure plate, at least one pressure plate displaceable to a limited extent in an axial direction for the frictional clamping of a clutch plate between the pressure plate and the counter-pressure plate, and at least one cup spring-like actuating device with at least one cup spring section and at least one support section for the torque-proof mounting of the actuating device on the counter-pressure plate, wherein the cup spring section transitions into the support section in a transition zone, and the transition zone has a contact region in which the cup spring section can be brought into contact with the support section at least during engagement and/or at least during disengagement of the clutch device.
