Abstract (en)  
[origin: WO2013068989A1] A heating radiator element (1) made of die-cast aluminium extends along a longitudinal axis (A) and has a monolithic aluminium structure (15), comprising a tubular body (2) and connections (7) which protrude from opposite sides of the body (2); the structure (15) is internally provided with a water circuit (16) for the circulation, in use, of a stream of water, while the volumes available for passage of the air around the structure (15) define an air circuit (17); the aluminium structure (15) and the water circuit (16) define heat exchange means such as to increase the aluminium/air heat exchange with respect to the water/aluminium heat exchange, increasing the volume of the air circuit (17) with respect to the volume generically available and specifically with respect to the volume of the water circuit (16).
