Abstract (en)

[origin: WO2013068258A1] The invention relates to a method for providing control power for a power network, in which the magnitude of the provided control power is determined as a function of a deviation of the actual alternating current frequency from a target alternating current frequency of the power network. According to the invention, the provision of the control power for increasing the yield is carried out in a pulsed manner, wherein the control power provided in a certain time interval from a pulsed operation corresponds to the control energy that is to be provided in the same time interval during a continuous operation of the source of the control power.
