Abstract (en)
A heating plate includes a thermally conductive, electrically insulating main board (1) on whose surface an electrically-conductive heat-generating circuit (30) and an outer insulating layer are layered. The heat-generating circuit is formed by connecting one first electrically-conductive layer (31) and one second electrically-conductive layer (32) that are arranged in different directions. The first and second electrically-conductive layers (31, 32) are overlapped to form an overlapping area (33). The heat-generating circuit has at least two electrically-conductive segments (34) exposed outside the outer insulating layer. Thereby, when the electrically-conductive segments (34) receive incoming current, the electrically-conductive heat-generating circuit (30) can generate heat rapidly, and the heat can be transmitted to the main board (1) through the thermally-conductive insulating layer. The overlapping area (33) formed at each turning point along the electrically-conductive heat-generating circuit (30) is more capable of load bearing so that the electrically-conductive heat-generating circuit (30) is unlikely to be damaged at the turning point.
