Abstract (en)

[origin: WO2013075097A2] The present disclosure relates to a system and methods for a board game in which boards, each containing multiple letters are combined in numerous combinations and configurations in order to generate and play different board games on different game boards. The object of the board game is for a player or team to place that team's colored translucent chips or tokens on letters and adjacent letters to create words, thereby creating a line or path of chips. By using this line of chips and adding to the line at each turn, the player or team can meet certain objectives, such as connecting various locations or ends on the game board, or racing from one end of the game board to the other, and other objectives as necessary to play each game.
