Abstract (en)

[origin: WO2013072499A1] The present invention relates to a method and a device for producing a round sling. This involves twisting together individual strands of thread (6) by means of a rotary bobbin rail (4) to form at least one longitudinally extended scrim (2). The scrim (2) is laid about at least two mutually spaced apart return points (11, 12) to act as a load-carrying core of the round sling. The scrim (2) forming the core is enclosed by at least one fabric strip (1) that is sewn longitudinally at the edges by means of a sewing/closing device (8), defining a protective tube (1) inside the device.
