Abstract (en)  
[origin: EP2781242A1] The assembly has a gliding board (1) that is arranged with an external face, a cross-section, and an interface plate that is arranged to take part in the solidarization of one shoe of a gliding board and to receive a support force (F1) directed perpendicular to the external face. A force conversion device is arranged to convert the support force into a force having a direction inclined with respect to a component perpendicular to the external face so as to oppose increase of the cross-section towards the external face of the board. An independent claim is also included for a gliding board.
