Abstract (en)

[origin: WO2013076100A1] The composition according to the invention comprises a very major proportion of inert charcoal and a minor proportion of active charcoal and is in pulverulent form, consisting of particles with a diameter of less than 200 µm, in the form of a powder or of granules. The inert charcoal used has a specific surface area of between 100 m²/g and 200 m²/g and comprises 60% to 80% of particles having macropores, 5% to 10% of particles having mesopores and 5% to 15% of particles having micropores. The active charcoal used has, for its part, a specific surface area of between 800 m²/g and 1200 m²/g and essentially has micropores. According to the embodiment, the composition can also comprise a proportion of Montmorillonite green clay and/or a minor proportion of ionized water. The composition according to the invention makes it possible to treat plants infested with fungi, without using pesticides.
