Abstract (en)

[origin: WO2013078203A1] Apparatus and methods for providing enhanced stability to the wearer of a heeled shoe. In one embodiment, the apparatus enables individuals to walk on soft or uneven surfaces while wearing heeled shoes with increased stability. The stability apparatus is composed of a substantially planar plastic body having one or more means to permit affixing the apparatus to the bottom of a heeled shoe. The bottom surface of the apparatus may be further adapted to provide additional support by comprising a material which provides traction. The apparatus is in one embodiment minimally visible from most angles which a third party would view the shoe to which it is attached. This may be further facilitated by forming the apparatus out of a transparent material.
