Abstract (en)

[origin: EP2784603A1] The device (100) has a lever (4) for driving an indicating component. A sensor (3) controls the lever, and is in support against a cam (2) under the action of a return spring (6) to control a movement of the lever to drive the component in displacement during the passage of a side (23) of the cam in a displacement direction of the cam. The sensor moves with respect to the lever against the action of recall of a flexible blade (5) under the effect of an action force exerted by the side on the sensor during the passage of the side in another displacement direction of the cam.
