Abstract (en)

[origin: WO2013079870A1] The invention relates to a device for blacking out an opening, including two series of horizontal, parallel leaves (7, 9) that are each arranged in a vertical plane (P1, P2) and spaced apart from one another. The two series of leaves are mobile relative to one another in a main direction (D) for vertical or horizontal mobility that is orthogonal to the plane of the leaves or in a combination of the two. The blackout device makes it possible to minimise the entry of direct solar radiation via the opening while enabling the entry of air and diffused light.
