Abstract (en)

[origin: WO2013079137A1] The invention relates to a fluid energy machine, in particular for an exhaust-gas turbocharger of a motor vehicle, having a housing which has a receiving chamber (16) for receiving a rotor (18) which can be rotated relative to the housing about a first rotational axis (20) which runs in the axial direction, and at least one channel, through which a gas can flow and from which the gas can be guided via a feed channel (14) which is connected fluidically to the channel in a flow direction which runs obliquely with respect to the axial direction and obliquely with respect to the radial direction to the receiving chamber (16), or to which the gas can be guided via the feed channel (14) which is connected fluidically to the channel in a further flow direction which runs obliquely with respect to the axial direction and obliquely with respect to the radial direction from the receiving chamber (16), and having at least one guide element (12) which is arranged at least partially in the feed channel (14) and by means of which the gas which flows through the feed channel (14) can be deflected, wherein the guide element (12) can be rotated relative to the housing about a second rotational axis (38) which runs obliquely with respect to the axial direction and obliquely with respect to the radial direction.
