Abstract (en)
[origin: WO2013079679A1] The invention relates to a method for producing a core (1) for a projectile (2). So that the dividing behaviour of the projectile can be set in a simple manner, wherein the core is lead-free, it is proposed that one or more wires or wire sections composed of a lead-free material are compressed to form a cavity-free core (1), wherein the wires or wire sections have one or more geometrical shapes (3) in the interior or on the outside diameter and/or predetermined braking points (4) obtained during the compression are provided in the core (1).
