Abstract (en)  
[origin: WO2013080108A2] A gymnastic machine (3) is described comprising: a data processing unit and relative control station (4) operatively associated to said data processing unit, at least one short-range communication interface (6) operatively associated to said data processing unit. The short range communication interface (6) is configured to form a two-way short-range communication channel to receive at least one user identification code. A training system (100) for a user is also described, comprising: a portable electronic device (1) associated to the user; a short-range communication interface (2) operatively associated to said portable electronic device (1); said short range interface (2) being configured to form a two-way, short-range communication channel to provide at least one user identification code; the aforementioned gymnastic machine (3).
