Abstract (en)

[origin: CN203860646U] The utility model relates to a haircut device. The haircut device comprises a portable processing unit, the portable processing unit comprises an atomization mechanism (11) and at least one arm (5) with teeth (12), the teeth (12) are constructed to be used for injecting steam to hair (14) and are arranged in the longitudinal direction, and the teeth (12) are arranged side by side and respectively comprise two steam injection holes (15 and 16). The steam injection holes (15 and 16) are oppositely oriented in the longitudinal direction, and the adjacent steam injection holes of two adjacent teeth are arranged in a face-to-face mode. According to the device, atomizing is allowed to be performed on the two sides of the hair, and therefore steam treatment on hair is allowed to be optimized. According to various design modification examples of the haircut device, the haircut device is constructed to be used for allowing the hair to be straightened, curled and/or permed.
