Abstract (en)
A refrigerator is provided with: a thermal insulation box having a storage chamber and an opening connected to the storage chamber; and a refrigeration cycle for refrigerating the storage chamber. The walls configuring the thermal insulation box are configured so as to have a thermal insulation member sandwiched between an interior member and an exterior member. The exterior member of at least one of the walls has a projection projecting outward from the storage chamber or a recess sinking inward into the storage chamber. A heat-dissipating pipe that configures a section of the refrigeration cycle is positioned so as to contact the projection or recess at a location between the exterior member and the interior member.
