Abstract (en)

[origin: GB2497545A] An article to be worn on the lower torso of a wearer, such as a diaper is disclosed. It comprises a basis with a front region 1012, rear region 1018 and a crotch region (1015) between the front and rear regions 1012, 1018. The basis has a longitudinal centre line and two side margins (1027). It further comprises a first surface (1022), which is oriented towards a wearer during use, and a second surface opposite the first surface. The article also comprises a flexible skin dryness member (1030), which is attached to the first surface so that there is a space 1041, 1042 between the dryness member and the first surface along the longitudinal centre line. Preferably the spacing is in the form of a pocket for receiving the genitals. The side margins are over-folded so they overlay the flexible skin dryness member at least in the crotch region. The over-folded longitudinal side margins are connected to the skin dryness member by a connection, such as adhesive or by thermal bonding. In use, a passageway is formed that is positioned in registry with the urine excreting genitals.
