Abstract (en)

[origin: WO2013088008A1] The invention relates to a mail sorting machine (100) for flat objects (E) on edge, comprising first belt conveying means that are able to transport said flat objects (E) along a first path (C1), a plurality of sorting outlets each associated with a separating flap (1) that is able to move about a pivot axis (A) between a first position, in which it does not interfere with said first path (C1), and a second position, in which it closes off said first path (C1) so as to direct said flat objects (E) along a second path (C2), said separating flap (1) being suspended on a pivot pin (12) which only extends on one side of said flapper in order to leave the area under said separating flap (1) free.
