Abstract (en)
[origin: WO2013088029A1] Method of processing postal items with generation of numerical models of mailshots on an interactive station. A method of processing postal items according to which they are introduced in series into a sorting machine (2) comprising a sorting conveyer and sorting outlets (7), an image of each postal item is formed in the machine and undergoes processing for automatic recognition of address information so as to automatically direct the postal item to a determined sorting outlet (7), a numerical mailshot model is constructed in a database (15), before introducing the postal items into the machine (2), on the basis of an image of a postal item and defined by data characterizing the graphical appearance of the postal item in the image formed from an interactive acquisition station (9) disposed some distance from the machine (2), and this mailshot model is associated in said database (15) with indications exploitable by the recognition processing and also entered from the interactive acquisition station (9).
