Abstract (en)
[origin: WO2014108141A1] The present invention relates to a gaming and/or entertainment device, in particular in the form of a coin-operated and/or token-operated slot machine and/or gambling device, having a plurality of separate display units for displaying information, in particular contents of games and/or game information, wherein at least one of the display units is provided with a touch panel for inputting control commands by touch. According to the invention, the touch panel is of continuous design over, in each case, at least part of at least two different display units, at least one display unit of which has a concave display surface. As a result of the touch panel extending over the boundary region or the intermediate space between two display units, it is possible, despite the use of a plurality of display units, to obtain a continuously closed-off device front, as a result of which the design of the corresponding device wall is simplified and the protection against penetration into the housing at gap areas is increased.
