Abstract (en)

Wireless communication is proveded between moving bodies in a signaling system of the moving body traveling on a predetermined track such as a railway. By providing communication between multiple onboard control equipments, one control equipment conducts wireless communication with a base station while the other conducts wireless communication with a further onbaord control equipment on another train to which the first train is coupled. Without installing a transmission cable between the coupled trains , the train control system is capable of reducing facility costs and improving of operability.
