Abstract (en)

[origin: US2014306001A1] A transport container made from lightweight construction boards, having a base and upright walls extending around the base. In order to manufacture the transport container in a more cost-effective, more rugged and more easily repairable manner, the walls, at their lower end, have a flap which extends along the edge of the walls and is angled in the direction of the base and which is connected to the base. Wherein an upwardly curved channel is between the angled flap and the edge, and the walls, at their upper end, have an upwardly curving beading which has a shape which corresponds to the channel at the lower end of the walls. In order to obtain improved stability, the transport container, which is constructed in a modular manner, may be provided with a concealed frame of metal tubes.
