Abstract (en)

[origin: CN104110627A] An optical module (400) for a lighting and / or signaling device, comprising at least one light source generating a light beam, at least one cutting means from the light beam or the medium (s) cutoff being arranged (s) for generating at least a low cut and a cut side of the light beam from the light source and a first and a second optically active surfaces disposed in succession along the path of the light beam after the cutting means. The optical module is characterized by that the first optically active surface comprises at least a first series of patterns which extend in a first direction and the second optically active surface comprises at least a second series of patterns which extend in a second direction; said first and second directions being substantially perpendicular. Lighting and / or signaling motor vehicle comprises at least one such module.
