Abstract (en)

[origin: WO2013095984A1] The present invention is directed to a method of producing two or more thin-film interdigitated photovoltaic cells (100) comprising the steps of: a) providing a photovoltaic article comprising: a flexible conductive substrate, at least one photoelectrically active layer, and a top transparent conducting layer; b) forming one or more first channels (140) through the flexible conductive substrate to expose a portion of the photoelectrical active layer; c) applying an insulating segment to the conductive substrate and spanning the one or more first-channel; d) forming one or more second channels off set from the one or more first channels through the photoelectrically active layer to expose a conductive surface of the flexible conductive substrate; e) forming one or more third channels (170) off set from both the first channels and the second channels, through the top transparent conducting layer and to the photoelectrically active layer; and f) applying an electrically conductive material (180) above the top transparent conducting layer and in the second channels, thus producing two or more interconnected photovoltaic cells.
