Abstract (en)

The object of the invention are siding type profiles, intended for executing wall casings, in particular, on buildings, characterised by a structure enabling a stable connection of adjoining profiles and elimination of discontinuity between individual profiles. In the next aspect the object of the invention is a connection method of siding type profiles using the profiles according to the invention. A siding type profile, intended for executing wall casings, in particular, on buildings, containing a core, made of solid, foam or layer, material, and an external face or decorative layer, or its role is fulfilled by paint or the other thin decorative element, and elements used for connecting and fastening, characterized in that the profile 1 has diverse but mutually compatible ends in the shape of transversal catches 8,10 , containing projections 11, 13 and grooves 12, whereas on one end the transversal catch 8 is directed in the direction of the face layer 6 of the profile 1 , and on the other end the transversal catch 10 is directed in the opposite direction to the face layer 6 of the profile 1 , furthermore, the projections 11,13 make up no more than 50% and no less than 30% of the length of the catches 8, 10 .
