Abstract (en)
[origin: EP2797052A2] This invention realizes an image processing device or the like capable of detecting a salient region from one image with precision by effectively using Bayes' theorem even when prior information regarding the salient region is not given. A prior probability calculating unit calculates prior probability of a salient region so as to increase prior probability of each of pixels constructing a superpixel whose color distance from the periphery is large, a likelihood calculating unit calculates likelihood of the salient region, and a salient region detecting unit calculates posterior probability of the salient region by using the prior probability and the likelihood.
