Abstract (en)

[origin: WO2013098159A1] The invention relates to a panel (1) that has a frame (3) comprising two longitudinal frame sections (4) and two transverse frame sections (5). In order to develop this further in an advantageous manner, the invention suggests that said frame (3) comprises at least one engagement element (8) at each of its two longitudinal ends (7), this element extending adjacent to a support surface and transverse to a panel plane; and that said panel comprises a lattice which has longitudinal braces (17) and transverse braces (18), the edge-side longitudinal braces (17) engaging into undercut longitudinal grooves on the frame inner side of the longitudinal frame sections, or the edge-side transverse braces (18) engaging into undercut transverse grooves on the frame inner side of the transverse frame sections. The invention also relates to a system ceiling formwork that comprises at least the afore-mentioned panels (1).
