Abstract (en)  
[origin: WO2013098161A1] The invention relates to a lever device (28) for a fuel injection valve, comprising a housing (12) with a housing recess (14), at least one lever element (30) arranged in said housing recess (14), a drive element (26) arranged in the housing recess (14) and coupled to the at least one lever element (30) in order to act upon said at least one lever element in the direction of a force-action axis (A), and an output element (32) arranged in the housing recess (14) and coupled to said at least one lever element (30) such that this output element (32) may be moved in the force-action axis (A) direction by means of the at least one lever element (30). This at least one lever element (30) comprises a coupling section (34) that is designed or arranged in such a manner that said at least one lever element (30) is coupled to the housing (12), or to the output element (32), in a rotationally-fixed manner with respect to the force-action axis (A).
