Abstract (en)

[origin: US2013178334A1] In general, the present invention relates to exercise devices that lack, in whole or in part, a console. For example, an exercise device of the present invention may lack display screens and/or user input controls that selectively adjust an operating parameter of the exercise device. A console interface, or the portions of a console interface that are absent from an exercise device of the present invention may be provided by an external computing device that is communicatively connected to the exercise device. The external computing device may be individually and selectively connected to multiple exercise devices to as to provide a display screen and user input controls to a number of different exercise devices.
