Abstract (en)

[origin: EP2615505A1] The mechanism has a drive wheel (64) and a cam (10) that are arranged such that the cam is rotated to exhibit a radius of maximum indication relative to a nozzle in response to a triggering event. The radius is provided relative to the nozzle such that a clearance necessary for the nozzle to move from a resting surface to a maximum indication radius surface corresponds to a movement of a control lever (6), where the movement is equal or greater than another movement in which the nozzle moves from its rest position to its maximum indication position.
