Abstract (en)
[origin: WO2013104848A1] The invention relates to a hair colouring device and method. The method can be used to generate a hair colouring simulation using a target image of a user, said method comprising the following steps: an image module receives data from a target image to be processed; an interface module generates a user interface, allowing reception of the selection of at least one colouring zone identification point; after reception of the selection data, the interface module sends the data to a hair mask segmentation module; and the hair mask segmentation module extracts the zone corresponding to the user's scalp.
