Abstract (en)  
[origin: CA2861275A1] The invention relates to a method for producing a ceramic layer (18) on a surface formed from an Ni base alloy (17), comprising the following steps: producing a ceramic layer (18) containing ZrO<sub>2</sub> as a main component on the surface; producing a gas phase with a temperature in the range from 400 to 900 °C in which a vapour formed from a salt melt (8) with the components alkaline chloride - alkaline sulphate - ZnCl<sub>2</sub> is contained in a carrier gas formed from an inert gas with an addition of 0.5 to 10 wt% HCl; and bringing the ceramic layer (18) into contact with the gas phase for a sufficient duration of time so that an intermediate layer (19) with a thickness of at least 0.1 μm is formed between the ceramic layer (18) and the surface.
