Abstract (en)

A system (1) for disposing of contaminated/dangerous material or of at least one waste comprising a carriage (10) which delimits a containment compartment (4) configured to receive waste through a filling aperture (6) of the carriage (10). The carriage (10) delimits, downstream of the containment compartment (4) and in communication therewith, at least one exit aperture (8) of the waste, closed by a mobile carriage trap-door (12). Said carriage (10) comprises retention means of said trap-door (12) in a closed configuration of the exit aperture (8). The system further comprises at least one emptying station (14) comprising a collection chamber (16) positioned under the carriage (10) when the carriage (10) engages said station, and which is configured to receive the waste coming out of the exit aperture (8), for example by gravity. The emptying station (14) further comprises release means acting on the retention means to reach an open configuration of the carriage trap-door (12).
