Abstract (en)

[origin: WO2013113303A1] The invention relates to a fixing device for implantable myocardial electrodes that have at least one electrode pole (2), wherein the electrodes permit a monitoring and/or stimulation of the heart in humans in conjunction with a cardiac pacemaker connectable outside the body and wherein the electrodes are easily removable at any time after application by pulling. The fixing device is characterised in that the electrode pole (2) is secured by means of a combination of at least two fixing elements against undesirable dislocation, wherein the electrode pole (2) is secured either by means of at least one distal and at least one proximal fixing element or wherein the electrode pole is secured by two distal fixing elements.
