Abstract (en)

[origin: WO2013115701A1] The present invention refers to a lowered roof rack (6) with supporting elements (2) to support a load (8) on a vehicle, which, via lowering parts (1), has a lowered loading platform or loading surface (3) with retained height at rack mounts (5). The transverse supporting elements (2) maintain their original height at the ends (10) and can therefore be attached to the vehicle's existing fastening devices or rack mounts (5). The lowering parts (1) consist of angular portions (4, 4') as transition to the loading platform (3) on the supporting elements (2). The lowering parts (1) extend a distance downwards towards the load surface (3) and the vehicle roof (7) and make it possible to have a short predetermined minimum distance (11) between the vehicle roof (7) and the supporting elements (2), whilst the ends (10) of the supporting elements (2) are adjustable, slidable and fixable in fastening points (16) on the rack mounts (5), to achieve an adaptation to the width of the actual vehicle roof (7).
