Abstract (en)

[origin: WO2013118147A1] The present invention describes a transmission-movement kinematic mechanism for auxiliary devices. The mechanism is having a transmission-movement kinematic mechanism and a trip-indicator kinematic mechanism having an indicator flag. The operating connection between the mechanism and the trip-indicator kinematic mechanism are made by a lever which can further engage with another lever for allowing the indicator flag to be moved in a visible position for determining any fault.
