Abstract (en)

[origin: WO2013124598A1] The invention relates to a device (1) for mounting cornices or shelves relative to two bearing planes (P) forming an angle of less than 135° relative to one another, said device (1) comprising: at least one element (3) comprising at least one elastic means (4); at least two bearing points (5), each of said at least two bearing points (5) being arranged on one of said at least one element; a first bearing point (5a) and second bearing point (5b). Said at least one elastic means (4) and said at least two bearing points (5) define at least two positions: a first position (A) wherein said at least one elastic means (4) is in a state of attachment and said at least two bearing points (5) are each constrained by results (R) from one of said two bearing planes (P), said results (R) being substantially equal and opposite; said at least two bearing points (5) being separated by a distance (d1); a second position wherein said at least one elastic means (4) is in a state of compression; said at least two bearing points (5) are separated by a distance (d2), said distance (d2) being less than said distance (d1).
