Abstract (en)

[origin: WO2013124352A1] The present invention relates to a method for machining a material with a controlled/regulated tool with a cutting edge, particularly by milling, in which the thermal diffusivity of the material, the chip thickness, the geometry of the cutting edge, and also the life of the tool and wear data that characterize the wear behaviour of the tool are taken as a basis, by means of a programmable control device, for continually calculating a cut and advance speed using the Péclet number and using said speed to control/regulate the tool.
