Abstract (en)

[origin: US2014375069A1] A door handle assembly for a motor vehicle includes an operating handle, a coupling device, and a locking device which is moveably retained on a handle mounting. An acceleration force can move the assembly from a resting position in which an actuation of the operating handle is possible, in a first blocking direction in which an actuation of the assembly by the operating handle and/or the coupling device is blocked. The locking device can move from the resting position in a second blocking direction when acted on by an acceleration force, in which an actuation of the assembly via the operating handle and/or the coupling device is blocked, wherein the second blocking direction is in the opposite direction from the first blocking direction. Movement of the assembly is blocked by the operating handle, or the coupling device, even with alternating acceleration forces resulting from a crash.
