Abstract (en)

[origin: CA2853663A1] The invention relates to a rotor drum of a low-pressure compressor of an axial turbomachine. The drum comprises a wall generally symmetrical in revolution about its axis and following a generally curved profile. The wall is designed to support a plurality of blade rows. A first blade row is formed by an annular platform integrally formed with the wall at the peak of its profile in relation to the axis; and a second blade row directly downstream of the first and a third blade row directly upstream of the first are formed by one or more blade-retaining grooves formed on the wall. The first blade row and the drum form an integral assembly, eliminating certain vibrations. Anchoring the blades is hybrid or mixed. The rotor may be mounted in a housing with ring-shaped stators.
