Abstract (en)

[origin: WO2013129922A1] Device for separating out of a liquid for purifying floating components present in this liquid, comprising a container with at least one first inlet conduit on an upstream side for admitting liquid for purifying and at least one outlet conduit on a downstream side for discharging purified liquid, in which container a number of plates are placed mutually parallel at an acute angle relative to the horizontal for the purpose of allowing the liquid to flow between these plates in substantially horizontal flow direction while causing the floating components to be separated in upward direction along these plates, which device is provided with a number of mutually parallel partitions adjacently of the upper side of the plates and standing in transverse direction thereof, and is provided on the upstream side with a second inlet conduit for admitting a fluid.
