Abstract (en)
[origin: EP2822110A1] The invention relates to a power adapter. Plug input section of it comprises a plug bottom shell and a plug face shell, thus to form a cylindrical accommodating space. Inside of the accommodating space is arranged with a first conductive electrode slice group, a main positioning switch and at least two groups of standard plugs from different countries or regions. There are at least two guides formed along axial direction in the plug face shell. Guide quantity matches with that of plug group. The main positioning switch is located between each plug, and can move back and forth along radial direction under external force action. The main positioning switch is arranged with a reset spring, and one end of the reset spring touches inner wall of the plug face shell. There are at least two locating detents formed along the axial direction of the main positioning switch. Each plug is configured with a toggle button. A located block which is sure to touch the main positioning switch is formed on the plug body. So long as one group of plug thereof is at stretching out working state, any one group of other plugs inside can be selected for switchover, which is easy to operate.
