Abstract (en)

[origin: EP2824641A1] The present invention relates to a system and method for authenticating, identifying or marking objects or individuals, by providing security features on a display or surface for displaying a readable information pattern, consisting of at least one string of digits with numbers, symbols, letters and/or dots. The system and method triggers dynamic modifications of one or more digits within the string, which renders a readable digit into an unreadable digit. An object or individual is authenticated, authorised or marked when the readable and unreadable digits of the modified information pattern and the information pattern stored in a database have been changed, replaced or deleted in accordance with object-specific underlying command rules.
