Abstract (en)
[origin: WO2013135989A1] The mechanism for moving the lead holder (1) forward is actuated by a push device (6) which slides parallel to the longitudinal axis (X) of the tubular body (2). The inner portion (11) of the push device, which is inserted into the body (2), supports the rear end (16a) of the store (16) housing the lead. An annular wall (31) for retaining the push device is formed at the rear end side (2a) of the body, on an inner surface (31a) of which two longitudinal recesses are formed, preferably two slots, each of which has a rear edge delimited by a lug projecting radially inward relative to the remainder of the inner surface (31a). A projection (22) projects radially outward from an outer surface (f2) of the inner portion (11) so as to engage with the front of the lugs, and the inner portion (11) of the push device (6) is thus held inside the tubular body (2).
